

REDUX

state is created by
REDUCERS

reducer 1
reducer 2
reducer 3

use react-redux's
"combineReducers"

Root Reducer
creates global state

in React CONTAINER
use react-redux "connect" function

EX: export default `connect(mapStateToProps)(BookList);`
Now React Component is bonded to State

REACT

creates "smart" component
that knows & tracks
State
CONTAINER

① to do this import "connect"
function from Redux

② create function
MapStateTo Props
